Solution Sheet 18, September 15, 2015¹

1. Yes; see figure below.

2. We need k and n such that, $2^{k+1} + \dots + 2^{k+10} = 1 + 2 + \dots + n$. Simplifying $2^{k+2}(2^{10} - 1) = n(n + 1)$, which holds for $n = 2^{10} - 1$ and $k = 8$.
3. Construct a directed graph with 2000 vertices representing the people, with directed edges connecting the vertices. We want to find the smallest number of vertices with two edges connecting them. Each vertex has 1000 outgoing edges, so there is a total of $1000 \cdot 2000$ edges. The number of ways we can pair two vertices together is $2000 \cdot 1999 \cdot 2 = 1999 \cdot 1000$. So in the best scenario, whereby each vertex of the graph is connected by at least one edge, we still have $2000 \cdot 1000 - 1999 \cdot 1000 = 1000$ edges left over. The extra edges each have to connect vertices that are already connected, hence giving us at least 1000 pairs of friends.
4. Three. The Joker can look at the first three digits of Batman's password and copy them down, then he can then use the fact that the passwords are unique, and deduce

6.

Senior Questions

1. Let

$$a_n = \frac{(2n)!}{n!n^n}$$

If we take the natural log on both sides of the above equation, then

$$\begin{aligned}\ln(a_n) &= \frac{1}{n} \ln \frac{(n+1)(n+2)\cdots(n+n)}{n^n} \\ &= \frac{1}{n} \ln \frac{n+1}{n} + \ln \frac{n+2}{n} + \cdots + \ln \frac{n+n}{n} \\ &= \sum_{k=1}^n \frac{1}{n} \ln \left(1 + \frac{k}{n}\right)\end{aligned}$$

Notice that the RHS of the last displayed equation is a Riemann sum of $\ln(x)$ for $x \in [1; 2]$. As n gets very large, the Riemann sum for the approximation of $\ln(x)$ becomes the exact integral

$$\int_1^2 \ln(x) dx = 2 \ln 2 - 1;$$

fit a_n

3. Consider the finite sum $S_n = \sum_{k=2}^n \cos \frac{1}{2^k}$. Multiplying S_n by $\sin(\frac{1}{2^n})$, then using the trigonometry identity $2 \sin x \cos x = \sin 2x$ yields

$$\begin{aligned} \sin \frac{1}{2^n} S_n &= \sin \frac{1}{2^n} \cos \frac{1}{2^n} S_{n-1} \\ &= \frac{1}{2} \sin \frac{1}{2^{n-1}} S_{n-1} \\ &= \dots \\ &= \frac{\sin \frac{1}{2}}{2^{n-1}} = \frac{2}{2^n}. \end{aligned}$$

Therefore, $S_n = \frac{2}{2^n} \sin \frac{1}{2^n} = \frac{2}{2^n} \sin \frac{1}{2^n}$. But

$$\lim_{n \rightarrow \infty} \frac{2}{2^n} \sin \left(\frac{1}{2^n} \right) = 2$$
